SKILLS

AWS (Lambda, Step Functions, SQS, EventBridge, Kinesis, DynamoDB, S3), AWS CDK / SAM, TypeScript, JavaScript, Node.js, Python, Express, React, Next.js, Kafka, MySQL, Redis, REST, Datadog, GitLab CI/CD, Linux, Git, Cursor, Claude

EXPERIENCE

Software Engineer

Orion Innovation

March 2021 - Present

- Serverless healthcare contact-center (Twilio, AWS Lambda, Step Functions, SQS, Kinesis, Kafka) with React Flex UI.
 - Built Node.js/TypeScript AWS Lambda services (Middy, AWS SDK v3) on SAM and CDK for SMS, voice, email (SES), fax, and live chat, orchestrated by 13 Step Functions workflows with retries and quiet-hours rules.
 - Built a CDC mesh (Kinesis -> FIFO SQS with DLQs -> Kafka) with per-entity ordering and DynamoDB idempotency so at-least-once delivery is exactly-once at the consumer.
 - Shipped a Do-Not-Contact service end to end: an Aurora MySQL table with E.164 and uniqueness constraints via Liquibase, a validated Lambda API, and a pre-dial check in the React agent desktop.
 - Designed and owned a CDK WAF service for every public REST API: tag-based discovery, fail-on-zero when none match, Datadog logging, and a count-then-block rollout; owned GitLab CI/CD (OIDC) for SAM/CDK stacks.
 - Auth at the API edge: API Gateway NONE plus Middy authorizeWith (Okta JWT, Twilio HMAC); called out fail-open if the middleware is omitted vs a deny-by-default authorizer.
 - Iterated merge requests against an internal AI code reviewer; used Cursor and Claude for codegen and refactors inside that review loop, not as a private shortcut.
- Microservices-based system with React, Node.js, MySQL, and Kafka for messaging.
 - Diagnosed slow MySQL queries; composite indexes and join refactors cut report-generation CPU by **50%**.
 - Improved notification-queue throughput by **~13x**; scaled UPP containers from **14 to 8** with no performance loss.
 - Led full-stack CDR features (Next.js, NestJS, PostgreSQL) and fixed Keycloak ↔ external SAML auth.
- Telecom provisioning platform for millions of users across 4 regions (Culpepper, London, Sydney, UAE).
 - Added features to the in-house platform with region-specific customizations.
 - Implemented soft delete before monthly budget reports; saved the company **~\$20,000** in the first month.
 - Cut compute consumption by **60%** after customer growth outgrew the original design.

Software Engineer

Netaş – NetRD

August 2020 - March 2021

- Legacy 3-tier application built with LAMP stack (Linux, Apache, MySQL, PHP), Mongo, Clickhouse
 - Telecom provisioning web application for enterprises to configure and manage their communication services.
 - Built an analytics pipeline to collect and process high-frequency SIP registration messages.
 - Migrated analytics storage from MongoDB to columnar *ClickHouse*, eliminating full-document scans.
 - Reduced query latency by **50%**, enabling real-time operational monitoring.

Systems Engineer

Cengiz & Saab Technologies J.V.

June 2017 - August 2020

- Maintained Surface Movement Radars (SMRs), MLATs, Linux servers, and workstations at Istanbul New Airport ATC tower.
- Configured 3rd-party interfaces: switches, VLANs, port assignments, routing, and TCP/IP/UDP.
- Tooling: Linux, Wireshark, Git, Spectrum Analyzer

CERTIFICATES

- [AWS Certified Solutions Architect – Associate](#)
- [AWS Certified Cloud Practitioner](#)

May 2025
August 2024

EDUCATION

Istanbul Technical University

Bachelor of Science - Electronics Engineering

GPA: 3.65/4.0
